

Expected and measured traffic

Model error with 95% t intervals

COMPLETE CALIBRATION | N = 256; B = 64 B; 8 configurations x 5 runs; 3,072 measured requests per run.
 Labels show (Z,A,S). Path uses an equal-length reference window; other protocols cover four full maintenance cycles.
 No recursive maps or network latency are measured. Model agreement at this scale does not certify larger configurations.
