

Public command-key locality replay

SDE vs Deferred R0 vs Ring

N = 16,384; B = 64 B; 2,048 warmup + 4,096 measured commands per window.

Five preselected adjacent windows per trace. Whiskers: observed min-max, not confidence intervals.

Counts all frontend/backend, authentication, maintenance and padding bytes in the implemented variants.

Command start keys only; original I/O sizes and arrival times are not replayed. No native-system or latency claim.
